

inViu NFC-tracker

The comprehensive Android NFC tracking solution for your assets and mobile employees

Remotely manage mobile employees and their tasks with ease using the inViu NFC-tracker Android app and off-the-shelf NFC capable Android phones. This software reads data from NFC-TAGs and sends that data to ENAIKOON's inViu server. With inViu pro plugins, like tour-checker, this data can be analyzed for various purposes. Users of the NFC-capable phone can log in with a personal PIN, allowing multiple employees to use the same phone with the data assigned to the correct employee.

This solution is effective for companies that require task verification of mobile employees that travel to many different locations.

Benefits of using inViu NFC-tracker

- improves operation efficiency with staff punctuality and adherence to schedules
- helps perfect time management and scheduling
- allows remote training and management of employees
- proves verification of work completed for your clients
- automatically manages cost centre allocation
- improves payroll data collection
- monitor employees even in buildings where there is no GPS reception

Typical applications

Security

- tracks scheduled guard tours by security guards
- ensures timely tours while tracking the time stamp, location, and employee for each tour

Health care

- tracks nurse visits to in-home patients, locations of equipment, and access control for certain rooms and equipment
- helps eliminate paperwork and increase patient care time for health care workers

Retail

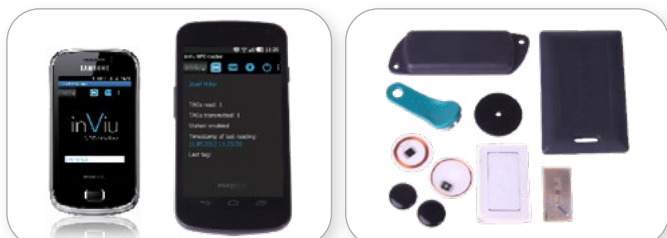

- streamlines retail merchandising and rack jobbing tasks while monitoring field representatives
- creates accurate stock counts and paperless accounting

Workforce

- monitors employee working hours and task completion
- remote employee training possible

Inventory

- tracks the location and status of inventory
- saves time and paperwork

How it works

The inViu NFC-tracker system consists of three components:

- **NFC-TAGs**
task locations, check-in points, equipment, and inventory items are equipped with tamper-proof NFC-TAGs
- **NFC-capable Android phones**
employees are given smartphones with the inViu NFC-tracker app to scan the NFC-TAGs (e.g. Samsung Galaxy Mini 2 S6500, LG P-940 Prada Phone, Samsung Galaxy Nexus i9250)
- **inViu pro: tracking management software**
the web portal allows you to set up every mobile worker's work schedule and tasks while getting an overview of all projects; all NFC-TAG scans are sent to inViu pro and are stored in its database

Once all components are installed, you can assign specific information or instructions on the NFC-TAGs, assign personal PINs to each employee, and enter the task list for every mobile worker in inViu pro. If an employee

deviates from the planned schedule, this deviation will automatically be detected according to predefined parameters. E-mail or text message (SMS) notifications can be sent to your mobile phone, which allow you to respond immediately to irregularities and deviations.

When the inViu NFC-tracker is used in conjunction with the ENAIKOON tour-checker plugin, it allows you to monitor your employees' tours to recurrent destinations. This plugin is extremely useful for companies with mobile workers.

Easy integration into existing applications

Many companies are already using high-tech, business-critical software for managing their core operations and have further plans to extend the functionality of their system with telematics technology.

Incorporating software systems like the inViu NFC-tracker is something that can be done seamlessly and without disruption to your daily business operation.
